**Please find below and/or attached an Office communication concerning this application or proceeding.**

The time period for reply, if any, is set in the attached communication.

# Office Action Summary

## Application No.

10/551,590

## Applicant(s)

TENNISON ET AL.

## Examiner

DANIEL MILLER

## Art Unit

1794

-- The MAILING DATE of this communication appears on the cover sheet with the correspondence address --  
**Period for Reply**

A SHORTENED STATUTORY PERIOD FOR REPLY IS SET TO EXPIRE 3 MONTH(S) OR THIRTY (30) DAYS, WHICHEVER IS LONGER, FROM THE MAILING DATE OF THIS COMMUNICATION.

- Extensions of time may be available under the provisions of 37 CFR 1.136(a). In no event, however, may a reply be timely filed after SIX (6) MONTHS from the mailing date of this communication.
- If NO period for reply is specified above, the maximum statutory period will apply and will expire SIX (6) MONTHS from the mailing date of this communication.
- Failure to reply within the set or extended period for reply will, by statute, cause the application to become ABANDONED (35 U.S.C. § 133). Any reply received by the Office later than three months after the mailing date of this communication, even if timely filed, may reduce any earned patent term adjustment. See 37 CFR 1.704(b).

## Status

- 1) ☒ Responsive to communication(s) filed on 12/14/2007.
- 2a) ☐ This action is **FINAL**. 2b) ☒ This action is non-final.
- 3) ☐ Since this application is in condition for allowance except for formal matters, prosecution as to the merits is closed in accordance with the practice under *Ex parte Quayle*, 1935 C.D. 11, 453 O.G. 213.

## Disposition of Claims

- 4) ☒ Claim(s) 35-59 is/are pending in the application.
- 4a) Of the above claim(s) \_\_\_\_\_ is/are withdrawn from consideration.
- 5) ☐ Claim(s) \_\_\_\_\_ is/are allowed.
- 6) ☒ Claim(s) 35-59 is/are rejected.
- 7) ☐ Claim(s) \_\_\_\_\_ is/are objected to.
- 8) ☐ Claim(s) \_\_\_\_\_ are subject to restriction and/or election requirement.

## Application Papers

- 9) ☐ The specification is objected to by the Examiner.
- 10) ☐ The drawing(s) filed on \_\_\_\_\_ is/are: a) ☐ accepted or b) ☐ objected to by the Examiner.  
Applicant may not request that any objection to the drawing(s) be held in abeyance. See 37 CFR 1.85(a).  
Replacement drawing sheet(s) including the correction is required if the drawing(s) is objected to. See 37 CFR 1.121(d).
- 11) ☐ The oath or declaration is objected to by the Examiner. Note the attached Office Action or form PTO-152.

## Priority under 35 U.S.C. § 119

- 12) ☒ Acknowledgment is made of a claim for foreign priority under 35 U.S.C. § 119(a)-(d) or (f).
- a) ☒ All b) ☐ Some \* c) ☐ None of:
1. ☒ Certified copies of the priority documents have been received.
  2. ☐ Certified copies of the priority documents have been received in Application No. \_\_\_\_\_.
  3. ☐ Copies of the certified copies of the priority documents have been received in this National Stage application from the International Bureau (PCT Rule 17.2(a)).

\* See the attached detailed Office action for a list of the certified copies not received.

## Attachment(s)

- 1) ☒ Notice of References Cited (PTO-892)
- 2) ☐ Notice of Draftsperson's Patent Drawing Review (PTO-946)
- 3) ☐ Information Disclosure Statement(s) (PTO/SG/US)  
Paper No(s)/Mail Date \_\_\_\_\_
- 4) ☐ Interview Summary (PTO-413)  
Paper No(s)/Mail Date \_\_\_\_\_
- 5) ☐ Notice of Informal Patent Application
- 6) ☐ Other: \_\_\_\_\_

***Election/Restrictions***

Upon further consideration the examiner has withdrawn the restriction and all pending claims have been examined.

***Claim Rejections - 35 USC § 112***

1. The following is a quotation of the second paragraph of 35 U.S.C. 112:

The specification shall conclude with one or more claims particularly pointing out and distinctly claiming the subject matter which the applicant regards as his invention.

2. Claims 35-51, 53-54 are rejected under 35 U.S.C. 112, second paragraph, as being indefinite for failing to particularly point out and distinctly claim the subject matter which applicant regards as the invention.
3. Regarding claim 35, it is not clear how one forms a mixture of particles into a dough. The term "dough" is not clearly defined and is indefinite as it does not adequately define a structure or process. Clarification required. Claims 36-51 are rejected because they depend from independent claim 35.
4. Regarding claim 53, it is not clear what a "pore former" is. It could be a hollow sphere, air or other gases, irregularly shaped solids (of any size). The scope of the term is not readily determinable. Clarification required.

***Claim Rejections - 35 USC § 103***

5. The following is a quotation of 35 U.S.C. 103(a) which forms the basis for all obviousness rejections set forth in this Office action:

(a) A patent may not be obtained though the invention is not identically disclosed or described as set forth in section 102 of this title, if the differences between the subject matter sought to be patented and

the prior art are such that the subject matter as a whole would have been obvious at the time the invention was made to a person having ordinary skill in the art to which said subject matter pertains. Patentability shall not be negated by the manner in which the invention was made.

6. Claims 35-39, 41-45, 51-56, and 59 are rejected under 35 U.S.C. 103(a) as being unpatentable over Satchell (EP 0254551) in view of Krause (US 4,220,553).
7. Satchell teaches a porous phenolic resin article made by the method wherein a partially cured phenolic resin solid is ground to form particles and formed (shaped) into solid product that is subsequently sintered to form a stable sintered product (claim 1 ref.).
8. The phenolic resin can be a novolak resin (claim 5 ref.).
9. The carbon product can comprise a polyethylene glycol additive (claim 11 ref.).
10. The article is carbonized at a temperature above 600 degrees C (see ref. claim 14), overlapping applicant's claimed range.
11. Satchell teaches the article is useful for filters or membranes including carbon composites (page 2 lines 1-12), but does not specifically teach the addition of particles of a secondary material.
12. Krause teaches a filter-drier unit formed from porous blocks comprising granular (particulate) adsorbent materials such as zeolite molecular sieves, activated carbon, alumina, silica gel, or the like and wherein the granules have been adhered to each other by various binders (column 1 line 25-35). Krause further teaches that the binder material is a phenolic resin (claim 1 ref.). The solid porous filter comprising granular material, as stated above, uses the granular material to filter out particles of foreign matter and adsorbing water acids and other impurities (column 1 line 7-18).

13. It would have been obvious to one of ordinary skill in the art at the time of the invention to provide the granular material taught by Krause, mixed with the phenolic resin particles (taught by Satchell), since Krause teaches mixing phenolic resin and secondary particulate material in order to provide a porous filter that is more advantageously useful for filtering out particles of foreign matter and adsorbing water acids and other impurities.

14. Given the substantial similarity in the structure and process of Satchell in view of Krause to applicant's claimed invention the article and resin and secondary components are considered to have substantially similar functionality to that claimed by applicant. No patentable distinction is seen. For example, the secondary particles are considered to be added "without substantially changing the porosity of the secondary component" as required by applicant's claim 37, and the secondary component is considered to "modify at least one of other physical properties of the composite" as required by applicant's claims 43-44 and 55-56. The addition of the secondary particles to the resin would necessarily alter the thermal and electrical properties of the composite given the secondary particles comprise compositionally different material with different thermal and electrical properties.

15. Claims 35-38, 41-47, 51-59 are rejected under 35 U.S.C. 103(a) as being unpatentable over Satchell (EP 0254551) in view of van der Smitten (US 4,677,096).

16. Satchell teaches a porous phenolic resin article made by the method wherein a partially cured phenolic resin solid is ground to form particles and formed (shaped) into solid product that is subsequently sintered to form a stable sintered product (claim 1 ref.).

17. The phenolic resin can be a novolak resin (claim 5 ref.)

18. The carbon product can comprise a polyethylene glycol additive (claim 11 ref.).

19. The article is carbonized at a temperature above 600 degrees C (see ref. claim 14), overlapping applicant's claimed range.

20. Satchell teaches the article is useful for filters or membranes including carbon composites (page 2 lines 1-12), but does not specifically teach the addition of particles of a secondary material.

21. Van der Smissen teaches an air filter comprising a porous substrate formed from activated carbon and impregnated with aluminum or copper (column 2 lines 30-45). The aluminum and copper are impregnated into the filter so that the filter can be adapted to filter different impurities in the air (column 2 lines 45-50).

22. It would have been obvious to one of ordinary skill in the art at the time of the invention to incorporate the particles into the copper or aluminum particles of phenolic resin as claimed in order to provide a filter that can be adapted to filter different impurities in the air.

23. Given the substantial similarity in the structure and process of Satchell in view of Smissen to applicants claimed invention the article and resin and secondary components are considered to have substantially similar functionality to that claimed by

Art Unit: 1794

applicant. No patentable distinction is seen. For example, the secondary particles are considered to be added "without substantially changing the porosity of the secondary component" as required by applicant's claim 37, and the secondary component is considered to "modify at least one of other physical properties of the composite" as required by applicant's claims 43-44 and 55-56. The addition of the secondary particles to the resin would necessarily alter the thermal and electrical properties of the composite given the secondary particles comprise compositionally different material with different thermal and electrical properties.

24. Claims 40, 48-50 are rejected under 35 U.S.C. 103(a) as being unpatentable over Satchell (EP 0254551) in view of Krause (US 4,220,553), as applied to claims 35 and 38, and further in view of Noack (US 7,014,681).

25. Satchell in view of Krause, discussed above, teach all the limitations of claims 35 and 38, but do not teach a carbide secondary component formed during the sintering step or the step of further activating the sintered material with steam or carbon dioxide.

26. Noack teaches a carbon based porous filter that can have Si-based components added to it to form Silicon Carbide during heating processes (column 10 lines 30-55). The membrane is flexible and is advantageous for gas separation applications (column 1 lines 5-10).

Art Unit: 1794

27. If the Si-based compounds are added to Satchell in view of Krause as a secondary component they would necessarily form carbide during the sintering process in a manner substantially similar to that taught by Noack.

28. Noack further teaches pore size homogeneity, and activation of the carbon based filter is known to be desired by post treating the filter with H<sub>2</sub>O vapor (steam) or CO<sub>2</sub> (see column 8 lines 45-60).

29. Regarding claim 40, Satchell teaches that the pore size can be controlled by altering the particle size of the resin (page 3 lines 55-60 to page 4 lines 1-5). While Noack teaches that pore size and homogeneity, can be further controlled by post treating the filter with H<sub>2</sub>O vapor (steam) or CO<sub>2</sub> (see column 8 lines 45-60). It would have been obvious to provide a pore size within applicant's claimed range, or any desired range, based on the above teachings of Satchell and Noack dependent upon the particular application of the filters or membranes. No patentable distinction is seen.

30. It would have been obvious to one of ordinary skill in the art at the time of the invention to provide secondary components including Si-based carbide forming compounds in Satchell in view of Krause, as taught by Noack, In order to provide a flexible filter that is advantageous for gas separation applications (column 1 lines 5-10). It would further have been obvious to provide a post treatment process of Satchell in view of Krause in order to control pore size and homogeneity, and activate the carbon based filter via the post treatment of the filter with H<sub>2</sub>O vapor (steam) or CO<sub>2</sub> (see column 8 lines 45-60), as taught by Noack, improving the functionality of the filter.

***Conclusion***

Any inquiry concerning this communication or earlier communications from the examiner should be directed to DANIEL MILLER whose telephone number is (571)272-1534. The examiner can normally be reached on M-F.

If attempts to reach the examiner by telephone are unsuccessful, the examiner's supervisor, Keith Hendricks can be reached on (571)272-1401. The fax phone number for the organization where this application or proceeding is assigned is 571-273-8300.

Information regarding the status of an application may be obtained from the Patent Application Information Retrieval (PAIR) system. Status information for published applications may be obtained from either Private PAIR or Public PAIR. Status information for unpublished applications is available through Private PAIR only. For more information about the PAIR system, see <http://pair-direct.uspto.gov>. Should you have questions on access to the Private PAIR system, contact the Electronic Business Center (EBC) at 866-217-9197 (toll-free). If you would like assistance from a USPTO Customer Service Representative or access to the automated information system, call 800-786-9199 (IN USA OR CANADA) or 571-272-1000.

/KEITH D. HENDRICKS/  
Supervisory Patent Examiner, Art  
Unit 1794

Daniel Miller
